Code Review

1)

The first thing I want to improve is the BGM part. I want to hide it and use an icon to represent it, but this cannot be achieved with only HTML.

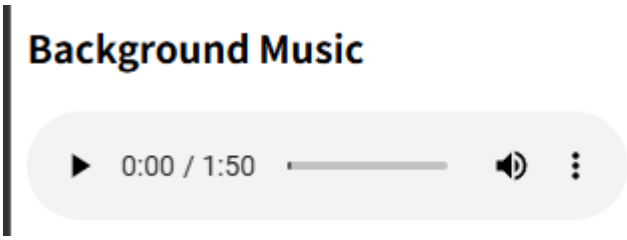
Code snippet:

```html
<h3>Background Music</h3>

<audio id="bgm" controls>
    <source src="assets/audio/background.mp3" type="audio/mpeg">
    Your browser does not support the audio element.
</audio>

<br><br>
```

Current outcome:



Desired outcome:

Instead of the default audio control bar, a speaker icon is used to control the background music (BGM) and appears on the navigation bar. A left click on the speaker icon toggles the music between play and pause.

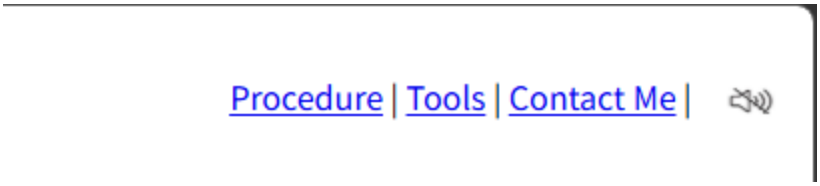
Fix solution:

```html
<img id="bgmBtn"
     src="assets/volume-off.png"
     alt="BGM Control">
```

```javascript
const bgm = document.getElementById("bgm");
const bgmBtn = document.getElementById("bgmBtn");

bgmBtn.addEventListener("click", function () {
    if (bgm.paused) {
        bgm.play();
        bgmBtn.src = "assets/volume-on.png";
    } else {
        bgm.pause();
        bgmBtn.src = "assets/volume-off.png";
    }
});
```

New outcome:



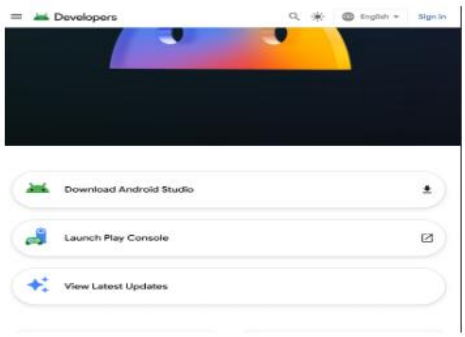
2)

Code snippet:

```
        <td align="center">
            <img src="assets/img/android_studio_interface.jpg"
                 alt="Example Android App Interface"
                 width="350"
                 height="250">
        </td>

        <td align="center">
            <a href="https://developer.android.com" target="_blank">
                <img src="assets/img/android_img.png"
                     alt="Android Development Environment"
                     width="350"
                     height="250">
            </a>
            <p><small>Click the image to visit Android Official Website</small></p>
        </td>
    </tr>
</table>
```

Current Outcome:



Click the image to visit Android Official Website

Desired Outcome:

The goal is to develop an interactive image feature that improves user experience.

When a user clicks on an image, a modal overlay appears, dimming the background and showing a larger version of the image in the center of the screen.

A close button is in the top-right corner, enabling the user to exit the view.

If the user clicks on the enlarged image, they are redirected to a related external website.

This interaction is implemented in a reusable way using a shared class and data attributes, allowing multiple images to use the same functionality.

Fix solution:

```javascript
const modal = document.getElementById("imageModal");
const modalImg = document.getElementById("modalImg");
const closeBtn = document.getElementById("closeBtn");

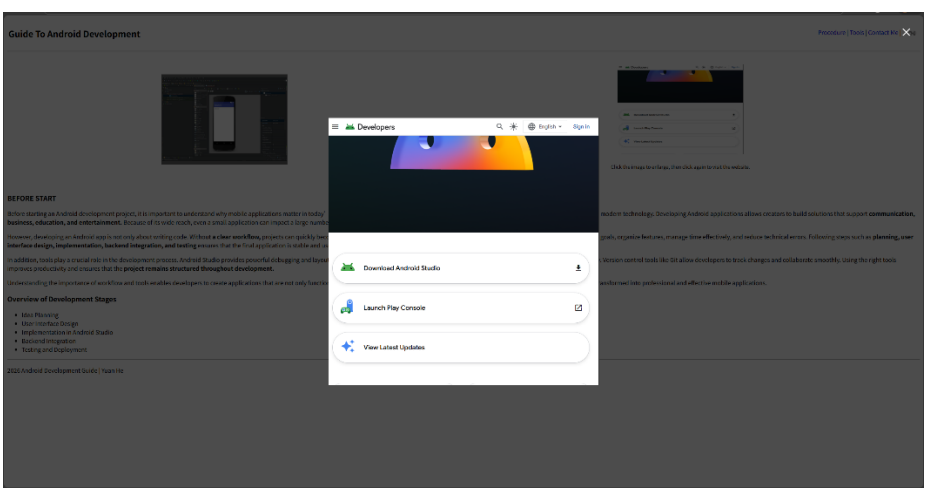
const images = document.querySelectorAll(".clickable-img");

let currentLink = "";

images.forEach(function (img) {
    img.addEventListener("click", function () {
        modal.style.display = "flex";
        modalImg.src = img.src;

        currentLink = img.dataset.link;
    });
});

closeBtn.addEventListener("click", function () {
    modal.style.display = "none";
});

modalImg.addEventListener("click", function () {
    if (currentLink) {
        window.location.href = currentLink;
    }
});
```


New outcome:
